DATA STRUCTURE LAB

ASSIGNMENT- 6

1. Your task is to write a C program that accepts two polynomials as input, performs the addition, and outputs the resulting polynomial.
2. Suppose you are working in a software company that specializes in mathematical computations. Your current task is to develop a program that can perform polynomial addition. Polynomials are algebraic expressions consisting of variables and coefficients. You need to create a program where the user can input two polynomials, and the program will return their multiplication.
3. WAP to implement Stack using an array:
    a. Push an element onto a stack.
    b. Pop the stack
    c. Display the contents of the stack.
4. WAP to implement Stack using linked list:
    a. Push an element onto a stack.
    b. Pop the stack
    c. Display the contents of the stack.
5. WAP to implement Queue using an array:
    a. Insert an element into the queue.
    b. Delete an element from the queue.
    c. Display the contents of the queue.
6. WAP to implement Queue using linked list:
    a. Insert an element into the queue.
    b. Delete an element from the queue.
    c. Display the contents of the queue.
