Scenario 1: Student Text Analysis

Problem Statement:

You are working as a data analyst in your university library. The library provides you with a text file containing the content of several research articles. Your task is to write a Python program that:

1. Reads the provided text file.
2. Prints all unique words in the file in **alphabetical order**.
3. Allows the user to **write a summary** of the file content into another text file.

Sample Text File (research_articles.txt):

Python is a popular programming language.
It is widely used in data science, web development, and automation.
Python programming helps in data analysis and machine learning.

Expected Output:

['a', 'and', 'analysis', 'automation', 'data', 'development', 'helps', 'in', 'is', 'language', 'learning', 'machine', 'popular', 'programming', 'python', 'science', 'used', 'web', 'widely']

Tasks for Students:

- Implement read and write operations in Python.
- Ensure the output list of words is **unique** and **alphabetically sorted**.

Scenario 2: Multi-format Data Processing

Problem Statement:

You are an intern at a data management company. You are given multiple files containing sales and customer data in different formats (CSV, TSV, Excel, Text). Your task is to:

1. Read the data from all the given files.
2. Copy the content of each file into a new file (e.g., output.csv, output.txt, etc.).
3. Print the first 5 lines of each file to verify its content.

Sample Files Provided to Students:

A1.txt - Scenario 1

A2.csv - Scenario 2

A3.tsv - Scenario 2

A4.xls - Scenario 2

A5.txt - Scenario 2
